Summary

The Louisiana Tumor Registry (LTR) is pleased to release *Cancer in Louisiana*, Volume 15, which provides statewide statistics on cancer incidence and mortality for the years 1994–1998. It also includes incidence statistics for the Industrial Corridor and compares state and national figures for incidence and mortality.

The monograph results from a collaborative effort of the LTR central office, its regional registries, hospital registries, other facilities in Louisiana, and the central registries of neighboring states. The LTR is grateful for the assistance and cooperation of all of these groups.

The data in this volume provide an accurate, meaningful description of cancer incidence and mortality in the state. A summary of the findings is presented below.

Incidence

- During this five-year period, 94,439 new cases of invasive cancer were diagnosed among Louisiana residents, averaging 18,888 a year, or about 52 cases a day (Table A1).
- The incidence rate for all cancers combined in Louisiana was 55% higher for males than for females. It is also higher for males nationally.
- The five most commonly diagnosed cancers among Louisiana males were those of the prostate (29% of all new cases), lung (20%), colorectum (11%), and bladder (5%) and non-Hodgkin's lymphoma (4%) (Table A2).
- The five most commonly diagnosed cancers among Louisiana females were cancers of the breast (33%), lung (13%), colorectum (12%), and uterine corpus (4%) and non-Hodgkin's lymphoma (4%) (Table A2).
- The incidence rate for all cancers combined was about 16% higher for black males (567.0 per 100,000) than for white males (487.4), and it was slightly lower for black females (314.4 per 100,000) than for white females (328.5) in Louisiana (Table C1).
- Louisiana incidence rates were generally lower than nationwide incidence rates. The only exception was Louisiana white males, with rates 5% higher than their national counterparts (Table H1).

Mortality

- During this five-year period, 46,290 Louisiana residents died of cancer, averaging 9,258 per year, or 25 per day (Table M1).
- The mortality rate for all cancers combined was 65% higher for males (248.7 per 100,000) than for females (150.4 per 100,000) (Table M3).
- The five leading causes of cancer death were lung (2,753 per year), colorectum (925), breast (707), prostate (585), and pancreas (485) (Table M1).
- Among males, the most common causes of cancer death were those of the lung (35% of total cancer deaths among men), prostate (12%), colorectum (9%), and pancreas (5%) and non-Hodgkin's lymphoma (4%). The same pattern occurs nationally (Table M2).
- Among females, the most common causes of cancer death were those of the lung (24% of all cancer deaths among women), breast (16%), colorectum (11%), pancreas (6%), and ovary (4%). These are also the leading causes of cancer deaths nationwide (Table M2).
- A total of 482 Louisiana women died from cervical cancer during these five years. With early detection and prompt treatment, these deaths could have been avoided (Table M1).
- Mortality rates for all cancers combined were considerably higher in Louisiana than nationwide for all four race-sex groupings (Table N).

Introduction to the Louisiana Tumor Registry

Purpose of the Registry

The Louisiana Tumor Registry (LTR) is mandated by law to collect, analyze and disseminate information on cancer in Louisiana. This statewide population-based cancer registry computes cancer incidence rates by age, race, sex, geographic region, and other population characteristics to identify subgroups in Louisiana that may be at particularly high or low cancer risk. Cancer incidence and mortality rates are also monitored over time. In addition, when funding is provided, the LTR conducts special cancer research studies, usually in collaboration with other researchers and institutions. These include studies of risk factors and patterns of care. Registry data provide the foundation for studies evaluating the efficacy of clinical therapies, changes in diagnostic procedures, public awareness campaigns and other cancer control initiatives, including screening programs.

This publication documents the occurrence of cancer in Louisiana, to identify those who can benefit most from cancer prevention and control programs and to indicate areas where scientific investigation is particularly needed.

History of the Registry

Cancer registration in Louisiana began in 1947 with the Charity Hospital Tumor Registry in New Orleans. This registry produced valuable data on treatment and survival, particularly among blacks, for the National Cancer Institute's (NCI) pre-1973 publications on "end results." Because the registry data were limited to patients receiving services in Charity Hospital, the reported cancer incidence statistics could not be generalized to Louisiana as a whole.

Population-based cancer registration began in New Orleans in 1974. The NCI provided funds for a population-based incidence and survival registry to cover the three parishes of the Greater New Orleans area as part of its Surveillance, Epidemiology and End Results (SEER) Program.

Data from the Louisiana Tumor Registry were included in the 1974–1977 SEER calculations of "national" cancer incidence rates. In 1979 the LTR was transferred to the state Office of Public Health, and federal funding ceased the next year. The catchment area for the LTR expanded in 1983 to include 35 south Louisiana parishes (Regions I–V), the addition of the remaining 29 northern parishes (Regions VI–VIII) in 1988 resulted in statewide coverage. In 1995, the registry was transferred to the LSU Board of Supervisors. Since then, the LSU Health Sciences Center (formerly the LSU Medical Center) in New Orleans has been responsible for the cancer registry program and has provided much of its funding.

The Louisiana Legislature has established broad guidelines for the creation and functioning of the Louisiana Tumor Registry. The operations of the registry are mandated by public law, R.S. 40:1299.80 et seq., which directs all medical facilities and health care providers to report all cancer cases to the registry. The same regulations mandate strict confidentiality of all data.

Oversight of the registry is exercised by the Louisiana Cancer and Lung Trust Fund Board, whose members represent various health institutions throughout the state and are appointed by the governor (see page 6). Vivien W. Chen, Ph.D., became director of the registry in 1991. In 2001 Louisiana was invited to rejoin the SEER Program as a probationary member.

Publication of the LTR Data

The *Cancer in Louisiana*^{1–14} series is the LTR's principal document for reporting cancer statistics. Volumes 1–14 have focused on the following:

- 1: Incidence, New Orleans area, 1974–1978; mortality, statewide, 1960–1981
- 2: Mortality, statewide, 1970–1979
- 3: Incidence, New Orleans vs. SEER areas, 1974–1981
- 4: Mortality trends, statewide, 1974–1981
- 5: Pediatric cancers, New Orleans area,

Louisiana Tumor Registry

8:	Incidence, statewide and by region, 1988–1992
9:	Incidence and mortality, 1989–1993
10:	Incidence and mortality, 1990–1994
11:	Incidence and mortality, 1991–1995
12:	Incidence and mortality, 1992–1996
13:	Incidence and mortality, 1993–1997
14:	Pediatric cancer, 1988–1996

LTR cancer incidence data are published yearly in the *Journal of the Louisiana State Medical Society*. In addition, *Cancer Incidence in Five Continents*, the authoritative source on worldwide cancer incidence, solicited data for the New Orleans region from the LTR for publication in its last four volumes. Central Louisiana was added to the most recent volume of this series.¹⁵ The North American Association of Central Cancer Registries (NAACCR) has included Louisiana incidence rates in all volumes of *Cancer in North America (CINA)*. In the 2002 *CINA* publication¹⁶ the Louisiana data again qualified for inclusion in the U.S. Combined Cancer Incidence Rates.

Operations of the Registry

Central and Regional Registries

The Louisiana Tumor Registry is composed of a central office and eight regional offices. The regions, based on historic health districts, are described on page 5. Each regional registry abstracts, compiles, stores, and edits data on cancer cases diagnosed in its parishes. The central registry consolidates, processes, and edits data from the regional registries, monitors completeness of case ascertainment, provides quality assurance services, and analyzes and interprets the statistical information derived from the data.

The LSU Health Sciences Center operates the LTR central office as well as the regional offices in Regions I, III, and VII. Local academic and medical organizations with cancer research and treatment interests coordinate the data collection activities in the five remaining regional registries (Regions II, IV, V, VI, VIII).

Collection of Incidence Data

Each regional office is responsible for the complete ascertainment of all data on cancer diagnoses and treatments provided in its region within six months of diagnosis. Every healthcare provider is required by law to report this information, and the regional offices work with providers to ensure full coverage. About one fourth of all hospitals in Louisiana maintain their own cancer registries and report about 60% of the state's total number of incident cases. Abstractors from the LTR's eight regional offices record cases from the remaining hospitals as well as from independent radiation centers and pathology labs.

Interstate exchange of data began in 1997. This permits the LTR to obtain cancer incidence data on Louisiana residents who have traveled out of Louisiana for cancer diagnosis and/or treatment. This exchange of data ensures a higher level of case ascertainment and completeness. Strict policies on patient confidentiality are followed.

Mandatory screening of records for cancer cases in medical facilities where cancer is diagnosed or treated has been an integral part of the success of the LTR. These sources include:

- hospitals
- private pathology laboratories
- freestanding radiation centers
- dermatology clinics
- one-day surgery facilities
- all other healthcare providers, including physician offices, if patients do not receive cancer-related services in the above places
- death certificates files

Most cancer cases are identified in hospitals by screening many types of records, such as:

- pathology reports including tissue (histology), cytology, hematology, bone marrow, and autopsy findings
- disease indices
- outpatient records
- radiation therapy logs
- radiology logs, including scans
- oncology services

Louisiana Tumor Registry

All death certificates with cancer mentioned as a cause of death for a Louisiana resident are checked against the registry's master file. If a match is not found, registry personnel review charts at the facility where the death was recorded, i.e., hospitals, nursing homes and coroners' offices. If the chart contains no mention of cancer or if the death occurred at home, the physician who signed the death certificate is queried. If the physician cannot be contacted or cannot provide information, the case is considered a "death-certificate-only" case and the date of death is recorded as the date of diagnosis. For the years 1994–1998, 1.6% of the LTR's incidence cases were identified by death certificate only; this was lower than figure for those NAACCR registries certified to be included in the U.S. Combined Rates.¹⁶

Demographic data on patients and detailed information on each primary tumor, including site, histology, staging information and diagnostic procedures, are collected on each cancer case. The first course of cancer-directed treatment planned or received during the four months following diagnosis is also recorded.

Primary site and morphology are coded according to the *International Classification of Diseases for Oncology, Second Edition* (ICD-O-2)¹⁷ or the *International Classification of Diseases for Oncology, Third Edition* (ICD-O-3).¹⁸ Stage of disease and other variables are coded following the conventions of NAACCR,¹⁹ the SEER Program,²⁰ and the American College of Surgeons.²¹

Reportable Diagnoses

The Louisiana Tumor Registry requires that all *in situ* and invasive neoplasms (those with behavior codes 2 or 3 as classified in the ICD-O-2 or ICD-O-3) be reported. Two types of cancer with these behavior codes are exceptions:

- Carcinoma *in situ* of the cervix has not been reported since 1992.
- Basal cell and squamous cell carcinomas of the skin are not reportable.

Data Quality

Quality assurance procedures at the regional and central levels minimize abstracting and coding errors. For many variables, the data entry software does not allow the use of invalid codes or the omission of required information. Each regional registry is responsible, according to its contract with the LSU Health Sciences Center, for the quality of the data collected. Regional supervisors edit abstracts for completeness and accuracy and run computerized edits on specific variables before submitting records to the central office. They also monitor the completeness of reporting and the quality of data by rescreening records at health care facilities and reabstracting a sample of cases for each abstractor.

The LTR central office staff extensively edits cases received from the regional registries. Emphasis is placed on key variables, such as age, race, sex, and parish of residence, as well as on the interpretation and coding of the primary anatomical site, staging information, diagnostic confirmation, and therapy received. Computerized edits check for duplicate cases and for other errors or inconsistencies, such as unlikely sex/site, site/morphology, or site/age combinations. When a cancer case is reported from more than one source, the information is consolidated into one record. Inter-record comparisons for patients with more than one primary cancer ensure that the demographic data are accurate on each record.

Frequency tabulations of variables such as percentages of cases microscopically confirmed or identified by death certificate only are compared with corresponding figures from NAACCR. If the LTR data diverge from these "gold standards," investigations and special studies are performed. Ratios of incidence to mortality also provide clues about reporting completeness.

After a region completes its case reporting for a given diagnosis year, a quality control (QC) supervisor from the LTR central office conducts field audits on cases from that region. The QC supervisor visits a sample of hospitals to evaluate

Louisiana Tumor Registry

the thoroughness of case finding and the accuracy of abstracting and coding. Periodic training sessions and workshops are held to ensure that regional and hospital registrars are following standard procedures.

Louisiana data have been further scrutinized by external auditors. Data for the diagnosis year 1992 were subjected to a statewide rescreening and reabstracting audit by staff of NAACCR, which found the LTR's reporting of cancer cases to be 97.6% complete. This exceeded the NAACCR goal of 95% for completeness of case ascertainment. In addition, these independent auditors identified only 0.05% of the cases as unresolved duplicates.

To enhance the quality of cancer incidence data across the United States, NAACCR sets standards for quality and completeness in cancer reporting. Data from registries that meet those standards are used to calculate the "U.S. Combined Cancer Incidence Rates" in NAACCR's annual publication, *Cancer in North America (CINA)*.¹⁶ Louisiana's data have qualified for inclusion in the "U.S. Combined Cancer Incidence Rates" for all *CINA* volumes.

Beginning in 1997, NAACCR began the formal

process of certifying registries whose data have achieved "excellence in the areas of completeness, quality, and timeliness." Since the inception of this program, the Louisiana Tumor Registry has been awarded certification each year; in 2001 and 2002 Louisiana was certified at the "gold" level.

The World Health Organization's International Association for Research on Cancer included both the New Orleans region and the Central Louisiana region in its most recent volume of *Cancer Incidence in Five Continents*.¹⁵ A rigorous editing process for demographic and medical accuracy precedes acceptance of data for this publication.

Confidentiality of Data

Louisiana law demands strict confidentiality and the protection of the identity of cancer patients and report sources in registry data. The same law also protects participating facilities or physicians from any liability that may arise from their reporting to the registry program. Registry personnel sign an "Agreement to Maintain Confidentiality of Data" and are subject to penalty if they, through gross negligence or willful misconduct, disclose confidential data. The LTR's data are published in aggregate form only.

Presentation of Data

Data Arrangement

Volume 15 of *Cancer in Louisiana* presents cancer incidence and mortality information about residents of Louisiana diagnosed with cancer between January 1, 1994, and December 31, 1998. These data are organized into seven sections of incidence information (Tables A–C and F–I) and two sections of mortality information (Tables M–N). Invasive cancers are arranged following the SEER Program's groupings. Carcinomas *in situ* of the breast are listed separately from the invasive cancers and are excluded from the "all sites" total.

To protect the confidentiality of patients, counts of less than six are suppressed. Rates are not computed for these cells. Suppressed cells are indicated by a tilde (~) in the tables.

Cancer Counts and Percent Distribution

Tables A1–A6 present total counts and percent distributions of cancer cases for Louisiana, South Louisiana and North Louisiana. Tables B1–B3 show the percentage of microscopically (pathologically) confirmed cancer cases, the percentage of cases reported by death certificates only and the percentage of cases with unknown race. The information in Tables B1–B3 indicates the reliability, completeness and quality of registry data compared with national standards (SEER and NAACCR). Number and percent distribution of cancer deaths are presented in Tables M1–M2.

Average Annual Age-Adjusted Rates

Tables C1–C3 present the cancer incidence rates for Louisiana, South Louisiana and North Louisiana, and Tables F1–F9 provide this information for each of the eight Louisiana regions (see table, page 5). The national annual incidence rates calculated by the SEER Program are found in Table H1 for comparison with the Louisiana rates.

Table I compares the average annual age-adjusted incidence rates for the seven-parish Industrial Corridor in Louisiana with the U.S. (SEER) rates. The Industrial Corridor consists of East Baton Rouge, West Baton Rouge, Iberville, Ascension, St. John the Baptist, St. James, and St. Charles parishes.

Table M3 presents the cancer mortality rates for Louisiana while Table N compares the Louisiana mortality rates with the U.S. rates.

Age-adjusted rates are the weighted average of the age-specific rates, where the weights represent the age distribution of a standard population. Age adjustment allows meaningful comparisons of cancer risk in different areas by controlling for differences in the age distributions of differing populations. This is important because cancer is diagnosed more frequently among the elderly.

Rates in this monograph are age adjusted to the 1970 U.S. standard population (see Appendix 3). Beginning with 1995–1999 data, however, all rates will be age adjusted to the 2000 U.S. standard population. Because the U.S. in 2000 is older than it was in 1970, the new standard will cause most rates to appear to rise markedly. Thus, incidence and mortality rates in future volumes should not be compared with those in this volume or previous volumes.

Ten Most Common Cancers

Tables G1–G4 show the average annual age-adjusted incidence rates for the ten most common cancers in Louisiana and in each of Louisiana's eight regions. Separate tables are provided for white males, white females, black males and black females.

Cancer Cases

Incidence data contained in this report are based on cases of primary cancer diagnosed among Louisiana residents between January 1, 1994, and December 31, 1998. Except where indicated, all only invasive cancers are included.

Presentation of Data

An incident case is defined as a "primary" cancer in contrast to a cancer that has spread, or metastasized, from another site. Since individuals can have more than one primary cancer, the number of incident cases will be greater than the number of persons who have been diagnosed with cancer. In a five-year period the number of primary cancers diagnosed in Louisiana is about 5% higher than the number of cancer patients.

The LTR follows standard protocols when computing and publishing cancer incidence data. Published data can be more readily compared with data from other registries when similar conventions are followed. These include:

- Primary site and histologic type are coded and reported according to the *International Classification of Diseases for Oncology, Second Edition* (ICD-O-2).¹⁷
- Sites are grouped according to code groupings of the SEER Program of the National Cancer Institute. These appear in Appendix 1.
- With the exception of bladder cancer, only invasive neoplasms are included in the tables. For cancers of the bladder, both *in situ* and invasive cases are included in the tables.
- Basal cell and squamous cell carcinomas of the skin are excluded.
- Neoplasms of the lymphatic, hematopoietic, and reticuloendothelial systems are grouped by their histologies (i.e. leukemias, lymphomas), not by the anatomical sites where they are diagnosed.

A total of 94,439 cases of invasive cancer were diagnosed from 1994 through 1998. Less than 1% of these cases were of unknown race. Cases with unknown race were included in the calculations of rates for "all races" but not in the race-specific computations. A high proportion of cases with unknown race can result in an underestimate of the "true" rates of the race group to which they belong. Cases of unknown or ill-defined site accounted for 2,983 (3%) of all Louisiana incident cancer cases. These cases were included in the counts and rates for cancer all sites. The coding of cancer as unknown or

ill-defined exerts a downward effect on the rates of the site-specific cancers.

Cancer Deaths

Information on residents of Louisiana who died with cancer during the period 1994–1998 was extracted from death certificate files obtained from the State Center for Health Statistics in the Louisiana Office of Public Health. Deaths are attributed to a specific cancer if the certifying physician lists it as the underlying cause of death.

The anatomical site group codes utilized for the mortality data are displayed in Appendix 2. These site groupings were developed by the SEER Program of the National Cancer Institute using codes from the *International Classification of Diseases, 9th Revision*.²²

Race

Race and ethnicity for cancer cases are based primarily on information contained in a patient's medical record. This information may include self-identification by the patient or the observations of an admissions clerk or other medical personnel. Race and ethnicity for cancer deaths are based on information on death certificates completed by a physician or coroner. The LTR has made great efforts to resolve discrepancies although some differences are still likely to exist.

Louisiana cancer incidence and mortality data include the racial categories of white, black and all races combined. Other groups were not analyzed separately because of their small numbers.

Comparison Groups

Incidence

National estimates of the average annual age-adjusted incidence rates were calculated from two sample populations:

Presentation of Data

- the "U.S. Combined Incidence Rate" of the North American Association of Central Cancer Registries (NAACCR).¹⁶

The SEER Program estimates in this volume include data from five state registries (Connecticut, Hawaii, Iowa, New Mexico and Utah) and four metropolitan areas (Detroit, Atlanta, San Francisco/Oakland and Seattle/Puget Sound). These registries represented about 10% of the U.S. population. Data from the 11 SEER geographic areas now represent an estimated 14% of the U.S. population. Data from the SEER Program are recognized for their high quality, and SEER computations have been traditionally cited as national estimates.

NAACCR's publication, *Cancer in North America*,¹⁶ includes a "U.S. Combined Cancer Incidence Rate," which presents incidence rates on the basis of data from selected state and metropolitan registries. These registries were selected because they meet or exceed the NAACCR criteria for data quality and completeness of reporting. The resulting national incidence rates represent about half the total U.S. population and include data from the SEER registries. The NAACCR "U.S. Combined Cancer Incidence Rates" are generally similar to the SEER estimates for the nation.

Mortality

Mortality rates for the United States are based on data from the National Center for Health Statistics, to which all states submit death certificate information.

Population Estimates

Five-year population estimates by race, sex and age for Louisiana were obtained from the National Cancer Institute and are based on the U.S. Census Bureau's estimates of the populations for the years

1994–1998. The estimated five-year populations are presented in Appendix 4.

Cautions in Interpretation

Incidence or mortality rates for many age/sex/race groups are 0.0. This indicates either that only a few cases were recorded, producing an annual rate of less than 0.05 per 100,000 or that no cases were reported for that group. Exact incidence and death counts (of six or more) for the state are available in Tables A1 and M1. Counts smaller than six are represented by a tilde (~) to protect the confidentiality of cases.

In comparing rates among geographic areas it is important to keep in mind that a variety of factors —other than a true difference in the risk of developing or dying from cancer—can contribute to variation in cancer rates. Some variation in cancer rates could occur by chance. Geographic variation should, therefore, be interpreted with caution and should be used to generate, not test, hypotheses.

Abbreviations Used in This Volume

LTR	Louisiana Tumor Registry
NAACCR	North American Association of Central Cancer Registries
—	Not Applicable
NOS	Not Otherwise Specified
SEER	Surveillance, Epidemiology and End Results Program of the National Cancer Institute
~	Case count is less than 6.
